WEATHER SYNOPSIS BY REGION

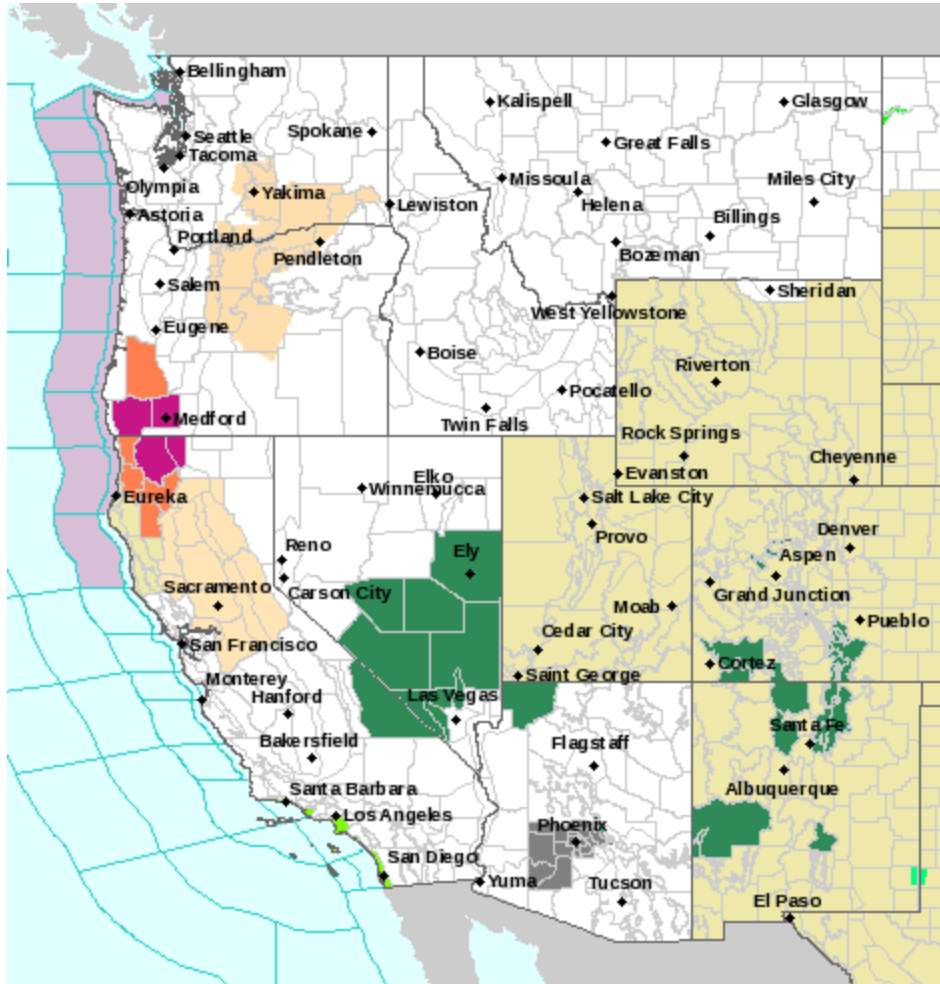

NORTHERN CALIFORNIA

The main weather story during the next several days will be hot conditions mixed in with periodic Monsoon Surge lightning episodes. Each episode will have its own distinct blend of atmospheric conditions thus leading to varying confidence levels and uncertainties when it comes to lightning placement and dry-wet impacts. The first such episode is expected to develop over the region late tonight and continue into Saturday. The center of the focus appears to be Friday, thus a high risk designation has been placed on a few predictive service areas (PSAs) then due to heightened potential of large fire. There is still some uncertainty concerning the coverage of the storms but expect isolated to widely separated thunder cells across the Coastal Mountains (Mtns), including Mid Coast/Mendocino northward to the NW Mtns PSA and extending east across the NE CA. Storm dryness is also somewhat sketchy but suspect most of the cells will be of the drier variety across the western and northern tier of the Region. Isolated wetter cells will be possible across the Northern Sierra during this first lightning episode period. Strongest winds through Saturday will be related to thunderstorm outflows although some localized areas along the Far Eastside and Delta Region should experience some afternoon breezes. Temperatures will remain hot with readings ranging between 5 to 15 degrees above normal although cloud cover late week will temper some of the readings. A weak trough to the north should nudge the high just enough to provide some drying later Saturday through early next week. The high is expected to become organized again and allow another Monsoon surge of moisture by the middle of next week. Hot temperatures would continue.

SOUTHERN CALIFORNIA

Temperatures will remain 5-10 degrees above normal the next few days with highs in the 90s in the valleys to 112 in the low desert. Most areas will see relative humidity (RH) minimums well above 25%, but the central coast interior (where thunderstorms are not expected) will see minimums in the 10-15% range the next several days. Friday, an area of high pressure building directly over the state should lead to a downward trend in convection. By Saturday and Sunday, most storms should be limited to the Sierras. No strong winds are expected through the period (except for local outflow winds from thunderstorms).
